ACKNOWLEDGEMENT

We take this opportunity to express our gratitude to the people who have been instrumental in the successful completion of this project, we take this opportunity to express our profound gratitude and deep regard to our guide **K.Srinu** Associate Professor for his exemplary guidance, monitoring and constant encouragement throughout the project work. The blessing, help and guidance given by him shall carry us a long way in the journey of life on which we are about to embark.

We take this opportunity to extend our heartfelt appreciation to the Project Review Committee (PRC) Coordinators— **Dr. J. Narasimharao, Mr. Md. Sajid Pasha, Mr. K. Praveen Kumar, Mr. D. Krishna Kumar, Mr. Y. Satyam and Mr. K. Srinu** —for their unwavering support, insightful guidance, and valuable inputs, which played a crucial role in steering this project through its various stages.

Our sincere appreciation also goes to our **Head of the Department**, for encouragement and continuous support in ensuring the successful completion of our project.

We are deeply grateful to **Dr. A. Raji Reddy**, Director, for his cooperation throughout the course of this project. Additionally, we extend our profound gratitude to Sri. **Ch. Gopal Reddy**, Chairman, Smt. **C. Vasantha Latha**, Secretary and Sri. **C. Abhinav Reddy**, Vice-Chairman, for fostering an excellent infrastructure and a conducive learning environment that greatly contributed to our progress.

We also acknowledge and appreciate the guidance and assistance provided by the faculty and staff of **CMR Technical Campus**, whose contributions have been invaluable in bringing this project to fruition.

Lastly, we sincerely thank our families for their unwavering support and encouragement. We also extend our gratitude to the teaching and non-teaching staff of CMR Technical Campus for their guidance and assistance. Their contributions, along with the support of everyone who helped directly or indirectly, have been invaluable in the successful completion of this project.

K.Akshaya (227R1A1231)

VISION AND MISSION

INSTITUTE VISION:

To Impart quality education in serene atmosphere thus strive for excellence in Technology and Research.

INSTITUTE MISSION:

1. To create state of art facilities for effective Teaching- Learning Process.

2. Pursue and Disseminate Knowledge based research to meet the needs of Industry & Society.

3. Infuse Professional, Ethical and Societal values among Learning Community.

DEPARTMENT VISION:

To produce technically proficient and skilled graduates in Information Technology and to prepare them to meet the needs of industry and society in a holistic learning environment.

DEPARTMENT MISSION:

1. To prepare students with the essential knowledge and contemporary abilities for solving emerging technological problems.

2. To train the students on cutting – edge computing facilities with industry interaction to enhance in practical exposure to real world situations.

3. To enhance the leadership qualities and team spirit with social values to serve the society.

ABSTRACT

The rapid growth of digital documentation in legal and financial sectors has created a strong demand for intelligent systems capable of quickly extracting meaningful insights from lengthy documents. Legal contracts, financial reports, agreements, and compliance documents often contain large volumes of unstructured text, making manual analysis time-consuming, inefficient, and prone to human error. With the advancement of Natural Language Processing (NLP) and deep learning technologies, automated document summarization has emerged as an effective solution for reducing information overload and improving decision-making efficiency. However, generating accurate and context-preserving summaries remains challenging due to complex sentence structures, domain-specific terminology, and the need to maintain semantic coherence. Traditional summarization methods such as frequency-based or rule-based techniques often fail to capture contextual relationships and deeper semantic meaning within documents.

To address these limitations, this project proposes a **Legal and Financial Document Summarizer** that utilizes advanced transformer-based deep learning models to generate concise and meaningful summaries. The system integrates **Sentence-BERT** for extractive summarization and **BART (Bidirectional and Auto-Regressive Transformers)** for abstractive summarization, enabling both key sentence extraction and human-like summary generation. The system also implements cosine similarity-based semantic ranking to identify the most relevant sentences and employs ROUGE metrics for evaluating summary quality. Additionally, a secure and user-friendly web interface built with **Streamlit** allows users to upload documents, visualize analysis results, and download professional PDF reports. Experimental results demonstrate strong performance with effective compression ratios and high-quality summaries. The proposed system significantly reduces document analysis time while maintaining contextual accuracy, making it a practical tool for professionals in legal, financial, and research domains.

1.INTRODUCTION

1. INTRODUCTION

Automatic text summarization involves extracting and generating important information from large documents using Natural Language Processing (NLP) and machine learning techniques. It helps in efficiently analyzing and understanding large volumes of textual data by producing concise summaries while preserving the key meaning of the original content.

Documents such as legal contracts and financial reports often contain complex language and large amounts of information, making manual analysis time-consuming. Automated summarization systems address this challenge by identifying the most important sentences or generating meaningful summaries, thereby saving time and improving efficiency.

There are two main approaches to text summarization. The first is **extractive summarization**, which selects important sentences directly from the document. The second is **abstractive summarization**, which generates new sentences that capture the overall meaning of the document in a more natural form.

1.1 PROJECT PURPOSE

The The purpose of this project is to develop an automated system capable of generating concise summaries of legal and financial documents using advanced Natural Language Processing (NLP) and deep learning techniques. In professional environments, large volumes of documents such as contracts, agreements, reports, and compliance records are generated regularly, making manual reading and analysis time-consuming and inefficient.

Traditional document analysis methods rely heavily on manual review, which requires significant effort and may lead to missed information or interpretation errors. This project to overcome these limitations by implementing intelligent summarization models that automatically identify and extract the most important information from lengthy documents.

By processing textual data and applying transformer-based models such as Sentence-BERT and BART, the system learns semantic relationships between sentences and generates accurate extractive and abstractive summaries. The developed model helps users quickly understand key points of complex documents, improving productivity and decision-making.

automatically identify and extract the most important information from lengthy documents.

By processing textual data and applying transformer-based models such as Sentence-BERT and BART, the system learns semantic relationships between sentences and generates accurate extractive and abstractive summaries. The developed model helps users quickly understand key points of complex documents, improving productivity and decision-making.

Ultimately, the project contributes to efficient document management and analysis by providing a scalable and user-friendly tool for summarizing large legal and financial documents in a short amount of time.

1.2 PROJECT FEATURES

The The **Legal and Financial Document Summarizer** project focuses on automatically generating concise and meaningful summaries from lengthy legal and financial documents using advanced Natural Language Processing (NLP) and deep learning techniques. The system processes uploaded documents, extracts textual information, and applies transformer-based models to identify important sentences and generate summaries. This automated approach helps professionals quickly understand key information in complex documents, reduces manual reading effort, and improves efficiency in document analysis.

Key Features:

- Automated detection of animal species from audio recordings
- Use of deep learning models for accurate classification
- Conversion of audio signals into spectrograms for analysis
- Ability to process large amounts of bio-acoustic data
- Supports wildlife monitoring and biodiversity conservation effort

2.LITERATURE SURVEY

2.LITERATURE SURVEY

Vaswani et al. introduced the Transformer architecture in the paper *"Attention Is All You Need"*, which revolutionized Natural Language Processing by replacing recurrent models with attention-based mechanisms. Transformers enable efficient modeling of long-range dependencies in text and form the foundation for many modern NLP models used in tasks such as machine translation, text classification, and document summarization.

Jacob Devlin et al. proposed **BERT**, a bidirectional transformer model that significantly improved contextual understanding of text. BERT reads text in both directions and generates contextual word embeddings, making it highly effective for tasks such as question answering, sentiment analysis, and text summarization.

Nils Reimers and Iryna Gurevych introduced **Sentence-BERT**, which modifies BERT to produce semantically meaningful sentence embeddings. By using cosine similarity between sentence vectors, Sentence-BERT enables efficient semantic similarity comparison, making it highly suitable for extractive document summarization and semantic ranking.

Mike Lewis et al. proposed **BART**, a transformer-based sequence-to-sequence model designed for text generation tasks. BART combines the bidirectional encoding capability of BERT with the autoregressive decoding ability of generative models, enabling it to produce fluent and coherent abstractive summaries.

Chin-Yew Lin introduced the **ROUGE** metric for evaluating automatic text summarization systems. ROUGE measures the overlap between machine-generated summaries and human-written reference summaries, and it has become a standard evaluation metric for summarization research.

Victor Sanh et al. explored efficient transformer architectures that reduce computational complexity while maintaining high performance in NLP tasks. Their research highlights the importance of optimized transformer models for real-world applications where processing speed and resource efficiency are critical.Yang Liu and Mirella Lapata proposed transformer-based approaches for document summarization that leverage contextual sentence representations and attention mechanisms to identify important sentences within documents. Their work demonstrates that deep learning models significantly outperform traditional rule-based and statistical summarization techniques.

speed and resource efficiency are critical.Yang Liu and Mirella Lapata proposed transformer-based approaches for document summarization that leverage contextual sentence representations and attention mechanisms to identify important sentences within documents. work demonstrates that deep learning models significantly outperform traditional rule-based and statistical summarization techniques.

Abigail See et al. introduced neural abstractive summarization models using sequence-to-sequence architectures with attention and pointer-generator networks. Their approach improves summary coherence and reduces repetition problems commonly seen in earlier neural summarization systems.

Alexander Rush presented neural attention-based summarization methods that apply encoder–decoder models to generate summaries directly from text documents. This work contributed to the development of modern abstractive summarization techniques used in deep learning frameworks.

Overall, these studies demonstrate the significant progress in automatic text summarization through deep learning and transformer-based architectures. The reviewed literature highlights the effectiveness of contextual embeddings, attention mechanisms, and neural sequence models in improving summarization accuracy and efficiency, forming the foundation for the development of the proposed **Legal and Financial Document Summarizer** system

2.1 REVIEW OF RELATED WORK

Several research studies have focused on automatic text summarization using Natural Language Processing (NLP) and machine learning techniques. Traditional summarization approaches mainly relied on statistical and rule-based methods such as Term Frequency–Inverse Document Frequency (TF–IDF), word frequency analysis, and sentence position scoring to identify important sentences in a document. These features were then used to generate extractive summaries. Although these methods provided a basic framework for summarization, their performance was often limited because they failed to capture the contextual meaning and semantic relationships between sentences.

In several earlier studies, machine learning algorithms such as Naïve Bayes, Support Vector Machines (SVM), and Decision Trees were used for text classification and summarization tasks. While these methods improved sentence selection to some extent, they still struggled to understand deeper semantic context in large and complex documents. As a result, the generated

summaries often lacked coherence and sometimes missed critical information present in the original document.

To overcome these limitations, recent research has shifted toward deep learning and transformer-based architectures for text summarization. Models such as Sentence-BERT and BART have demonstrated strong capabilities in understanding contextual relationships and generating meaningful summaries. Sentence-BERT is widely used for extractive summarization by generating semantic sentence embeddings and ranking important sentences using cosine similarity, while BART is used for abstractive summarization to generate human-like summaries.

In this project, a hybrid approach combining extractive and abstractive summarization techniques is implemented. The system utilizes Sentence-BERT for identifying key sentences and BART for generating coherent summaries from complex documents. Experimental results demonstrate that this approach improves summary quality, maintains contextual meaning, and significantly reduces the time required to analyze lengthy legal and financial documents. This highlights the effectiveness of transformer-based models for real-world document summarization applications.

2.2 DEFINITION OF PROBLEM STATEMENT

With the rapid growth of digital documents in legal and financial sectors, professionals must handle large volumes of text such as contracts, reports, and agreements. Manually reading and analyzing these documents is time-consuming and prone to human error.

Traditional summarization methods based on simple statistical techniques often fail to capture the contextual meaning of complex documents. As a result, important information may be missed or summaries may lack clarity.

Therefore, there is a need for an intelligent system that can automatically analyze large documents and generate concise, meaningful summaries while preserving the key information, helping users quickly understand complex content.

2.3 EXISTING SYSTEM

In In traditional document analysis systems, summarizing legal and financial documents was primarily performed through manual reading and review. Professionals such as lawyers, analysts, and auditors would carefully read lengthy documents like contracts, agreements, and financial reports to identify important information and key clauses. This process required significant time and effort, especially when dealing with large volumes of documents.

If any digital assistance was used, it mainly involved basic text processing tools that relied on keyword searching or simple statistical techniques to highlight important sections. Analysts often used document viewers or text analysis tools to manually inspect and extract relevant information. However, these traditional approaches were slow, labor-intensive, and depended heavily on human expertise to interpret complex legal and financial language.

The data collected through traditional document review methods were often limited and required extensive manual effort to analyze. Most documents had to be read and examined individually, and the extracted information was typically recorded manually for further analysis. This process was slow and inefficient, especially when dealing with large collections of legal or financial documents.

Early automated systems used basic text processing techniques such as keyword matching and frequency-based methods to identify important sentences. These approaches relied on simple statistical measures and manually designed rules, which often failed to capture the true contextual meaning of the text. As a result, the generated summaries were sometimes inaccurate and less effective for complex or large document datasets

Limitations of Existing System

Traditional document summarization relies heavily on manual reading and analysis, which is time-consuming and requires expert knowledge.

- Lack of automation makes it difficult to process large volumes of documents quickly.
- Basic text processing methods often fail to capture the contextual meaning of complex documents

- The quality of summaries depends on the individual's interpretation, leading to inconsistency and possible errors.
- Traditional document analysis relies on manual reading and summarization, which is time-consuming
- Lack of automation makes it difficult to handle large volumes of documents.
- Keyword-based and rule-based methods often fail to capture the true context of the text.
- Important information may be missed in lengthy documents.
- Traditional systems are not scalable for real-time document processing.

2.4 PROPOSED SYSTEM

- The proposed system focuses on automatically summarizing legal and financial documents using Natural Language Processing (NLP) and Artificial Intelligence (AI). The system processes large textual documents and extracts the most important information to generate concise and meaningful summaries.
- Document Dataset: Legal and financial documents such as contracts, agreements, and reports are collected and used as input data for the summarization system.
- Text Preprocessing: The documents are cleaned using NLP techniques such as tokenization, stop-word removal, and text normalization to prepare the data for analysis.
- Feature Extraction: Important textual features are extracted using NLP methods to identify key sentences and meaningful patterns in the document.
- AI/NLP Model Implementation: Machine learning and NLP-based models are applied to analyze the document structure and generate summaries automatically.
- Summary Generation: The system identifies the most relevant sentences and produces a concise summary while preserving the main meaning of the document.
- System Evaluation: The performance of the summarization model is evaluated based on accuracy and quality of generated summaries.
- Automated Output: The final system provides quick and efficient summaries, helping users understand lengthy legal and financial documents easily

Advantages of the Proposed System:

- Automated document summarization reduces the time and effort required to analyze lengthy legal and financial documents.
- The NLP and AI techniques improve the accuracy and quality of generated summaries by capturing contextual meaning
- The system can process large volumes of documents efficiently, making it suitable for large-scale data analysis.
- Automated summarization helps users quickly understand important information without reading the entire document.

2.5 OBJECTIVES

- To develop an intelligent system that automatically summarizes legal and financial documents using NLP and AI techniques.
- To collect and preprocess document datasets by cleaning text, removing stop words, and preparing the data for analysis.
- To extract important textual features from documents to identify key sentences and relevant information.

To design and implement NLP-based models that can generate concise and meaningful summaries.

- To evaluate the performance of the summarization system using appropriate evaluation metrics.
- To improve the efficiency of document analysis by reducing the time required to review lengthy legal and financial documents.
- To develop a user-friendly system that allows users to upload documents and obtain summaries easily.
- To support better decision-making by providing clear and concise summaries of important documents.

2.6 HARDWARE & SOFTWARE REQUIREMENTS

2.6.1 HARDWARE REQUIREMENTS:

Hardware interfaces specifies the logical characteristics of each interface between the software product and the hardware components of the system. The following are some hardware requirements,

- Processor: Intel i5
- Memory: 1 TB (storage)
- RAM: 8 GB

2.6.2 SOFTWARE REQUIREMENTS:

Software Requirements specifies the logical characteristics of each interface and software components of the system. The following are some software requirements,

- Python 3.7.6
- Operating system: Windows
- Frontend: Streamlit / Web-based Interface
- Database: TinyDB or JSON-based storage for document handling
- Libraries/Frameworks: NLP and AI libraries such as NLTK, Transformer

3.SYSTEM ARCHITECTURE AND DESIGN

3.SYSTEM ARCHITECTURE & DESIGN

The system architecture for summarizing legal and financial documents using Natural Language Processing (NLP) and Artificial Intelligence (AI) is designed to process large documents and generate concise summaries automatically. The architecture includes stages such as text preprocessing, feature extraction, model processing, and summary generation.

The system first accepts legal or financial documents as input and performs preprocessing steps like tokenization, stop-word removal, and text normalization. Important textual features are then extracted using NLP techniques and analyzed by AI models to identify key information.

Finally, the system generates a clear and concise summary of the original document, helping users quickly understand important content while reducing manual effort.

3.1PROJECT ARCHITECTURE

The diagram illustrates the workflow of the proposed system for summarizing legal and financial documents using NLP and AI.

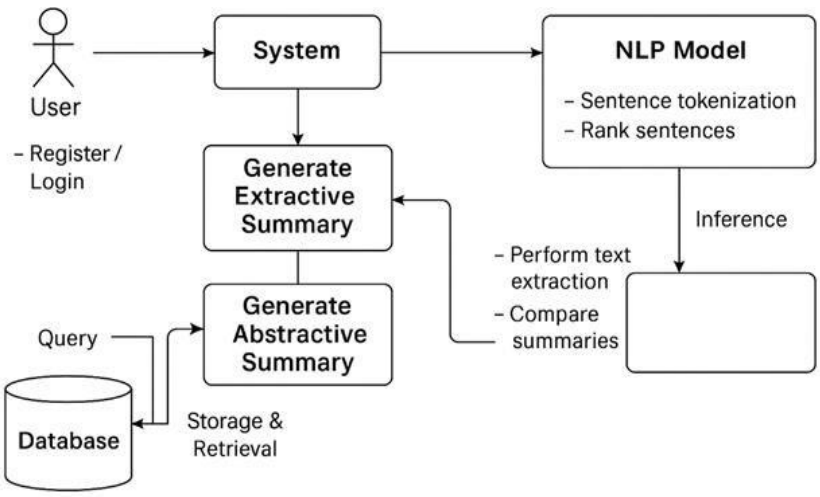

Fig 3.1: System Architecture for Summarizing legal and financial documents by ranking the sentences using NLP & AI Models.

3.2 DESCRIPTION

Dataset Acquisition: Legal and financial documents are collected from multiple sources and organized according to document type and content category.

Text Preprocessing: Documents are cleaned, tokenized, and standardized, removing noise such as stopwords, punctuation, and irrelevant formatting.

Feature Extraction: High-level textual embeddings are generated using pretrained NLP models to capture semantic, syntactic, and contextual information.

Feature Caching: Extracted embeddings and labels are stored to prevent redundant computations during repeated experiments.

Train–Test Splitting: The dataset is divided into training and testing subsets for unbiased model evaluation.

Model Training: Multiple classifiers, including conventional machine learning and transformer-based models, are trained using the extracted textual features.

Performance Evaluation: Models are evaluated with metrics like accuracy, precision, recall, F1-score, and confusion matrices to ensure reliable summarization.

Document Summarization: New legal and financial documents are automatically summarized, providing concise insights while retaining critical information.

User Interaction: A user-friendly interface allows easy execution of all stages, enabling both research experimentation and practical deployment.

3.2 UNIFIED MODELING LANGUAGE(UML)

Unified Modeling Language (UML) is not just a static set of diagrams; it's a versatile toolset that supports multiple views and perspectives of a system. This versatility allows UML to be

applied at different stages of the software development lifecycle, from initial requirements analysis and design to implementation, testing, and maintenance.

UML diagrams serve as a common visual language that bridges the gap between technical and non-technical stakeholders. They provide a means for software engineers to communicate complex system designs in a clear and concise manner, facilitating better understanding and collaboration among team members.

One of the key benefits of UML is its adaptability to different software development methodologies, such as waterfall, agile, and iterative approaches. UML diagrams can be used to model systems at various levels of abstraction, from high-level architectural views to detailed design specifications.

Furthermore, UML is not limited to software systems alone; it can also be applied to model and analyze business processes, organizational structures, and even hardware systems. This flexibility makes UML a valuable tool for a wide range of industries and domains.

GOALS OF UML

1. Provide users a ready-to-use, expressive visual modeling language so that they can develop and exchange meaningful models.
2. Provide extendibility and specialization mechanisms to extend the core concepts.
3. Be independent of particular programming languages and development processes.
4. Provide a formal basis for understanding the modeling language.

3.3 USECASE DIAGRAM

A use case diagram in the Unified Modelling Language (UML) is a type of behavioral diagram defined by and created from a Use-case analysis. Its purpose is to present a graphical overview of the functionality provided by a system in terms of actors, their goals (represented as use cases), and any dependencies between those use cases. The main purpose of a use case diagram is to show what system functions are performed for which actor. Roles of the actors in the system can be depicted.

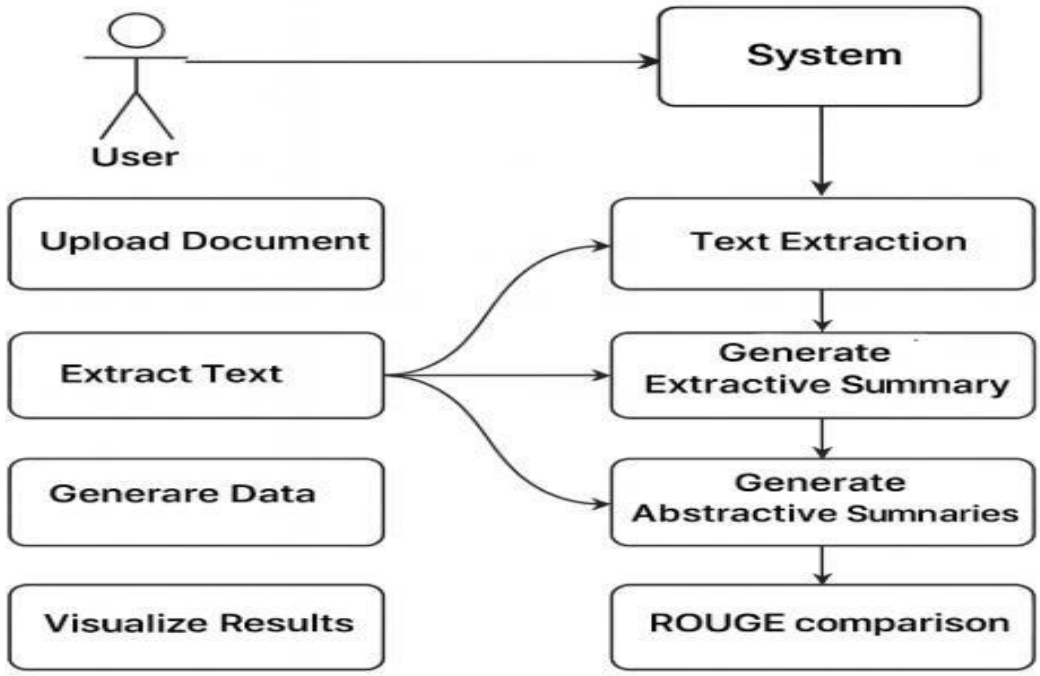

Figure 3.3 Use Case Diagram of Summarizing legal and financial documents by ranking the sentences using NLP & AI Models.

3.4 CLASS DIAGRAM

In software engineering, a class diagram in the Unified Modelling Language (UML) is a type of static structure diagram that describes the structure of a system by showing the system's classes, their attributes, operations (or methods), and the relationships among the classes. It explains which class contains information.

A class diagram is a static structural diagram that represents the structure of a system by showing the system's classes, their attributes, methods, and relationships among them. It provides a high-level view of the system's architecture, focusing on the entities (classes) and their interactions. Class diagrams are typically used during the design phase of Softwaredevelopment to visualize and organize the system's components and their relationships

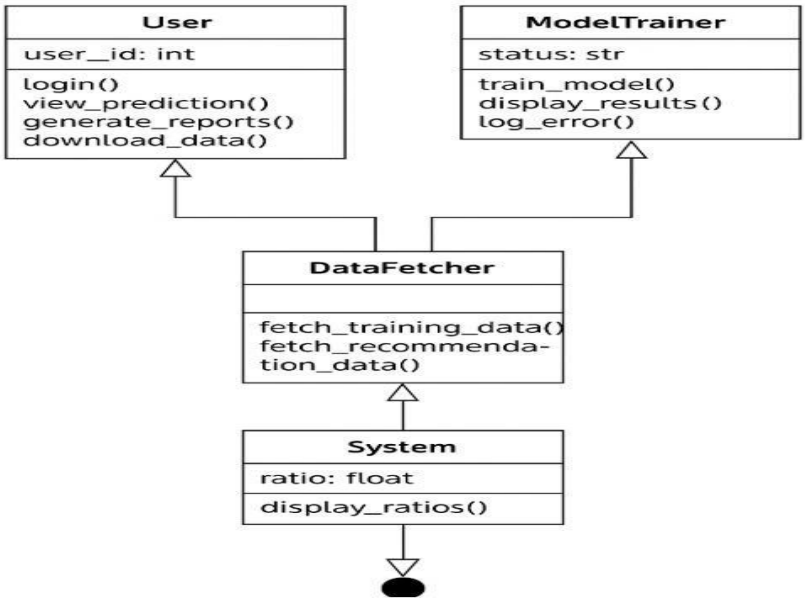

Figure 3.4 Class Diagram of Summarizing legal and financial documents by ranking the sentences using NLP & AI Models.

3.5 SEQUENCE DIAGRAM

A sequence diagram in Unified Modelling Language (UML) is a kind of interaction diagram that shows how processes operate with one another and in what order. It is a construct of a Message Sequence Chart. Sequence diagrams are sometimes called event diagrams, event scenarios, and timing

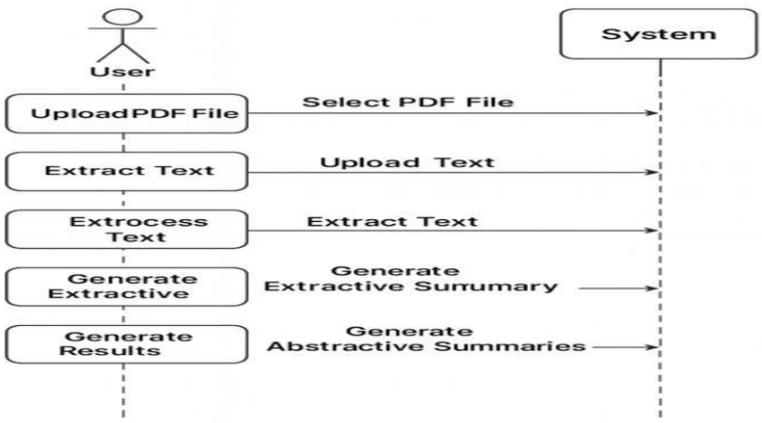

Figure 3.5 Sequence Diagram of Summarizing legal and financial documents by ranking the sentences using NLP & AI Models.

3.6 FLOW CHART DIAGRAM

A flowchart is a visual representation of a process, workflow, or algorithm. It uses symbols and arrows to show the sequence of steps, decisions, and actions in a structured manner. Flowcharts help in understanding, analyzing, and improving processes across various fields like programming, business, engineering, and education.

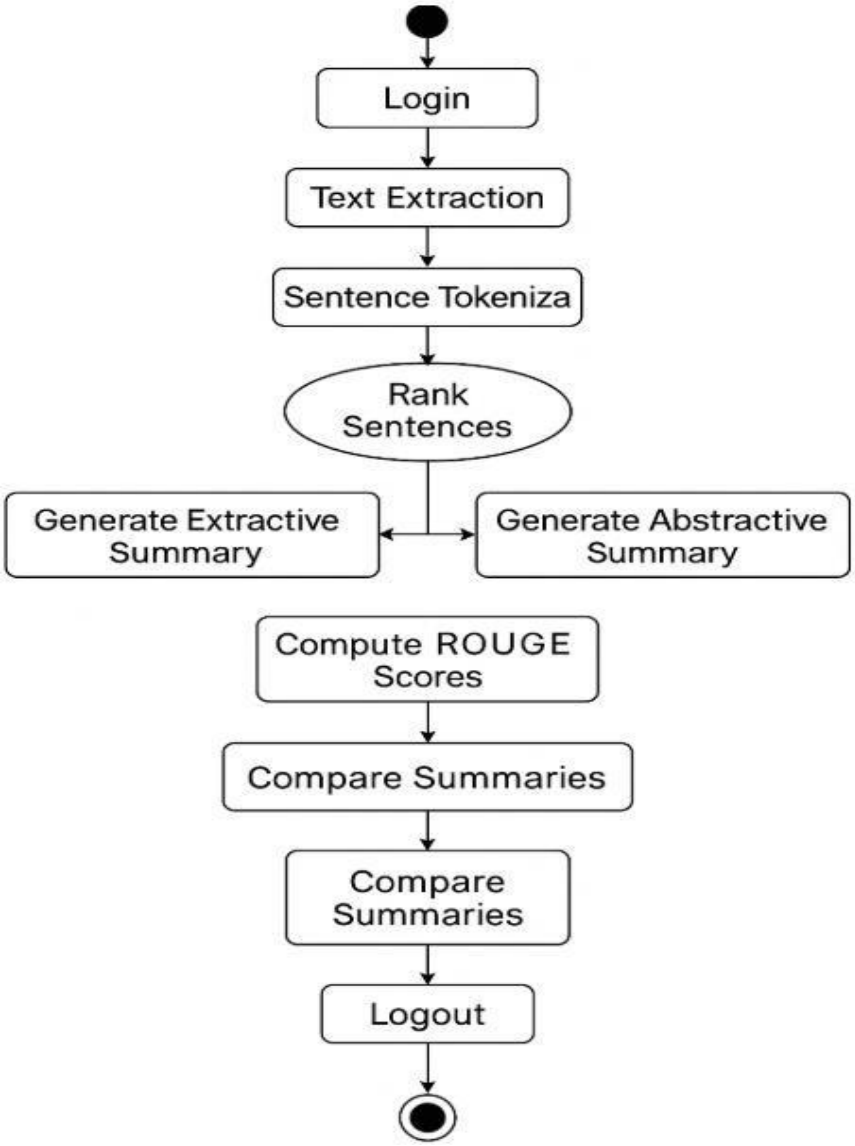

Figure 3.6 Flow Chart of Summarizing legal and financial documents by ranking the sentences using NLP & AI Models.

3.7 DATAFLOW DIAGRAM

A Data Flow Diagram (DFD) is a visual representation of the flow of data within a system. It illustrates how data moves from one part of the system to another, highlighting the processes that transform the data, the data stores that hold the data, and the external entities that interact with the system.

Data Flow Diagrams are a powerful tool in system analysis and design, providing a clear and structured way to visualize data movement and processing within a system. By understanding the components and best practices for creating DFDs, stakeholders can effectively communicate and analyze system requirements, leading to more efficient and effective system design.

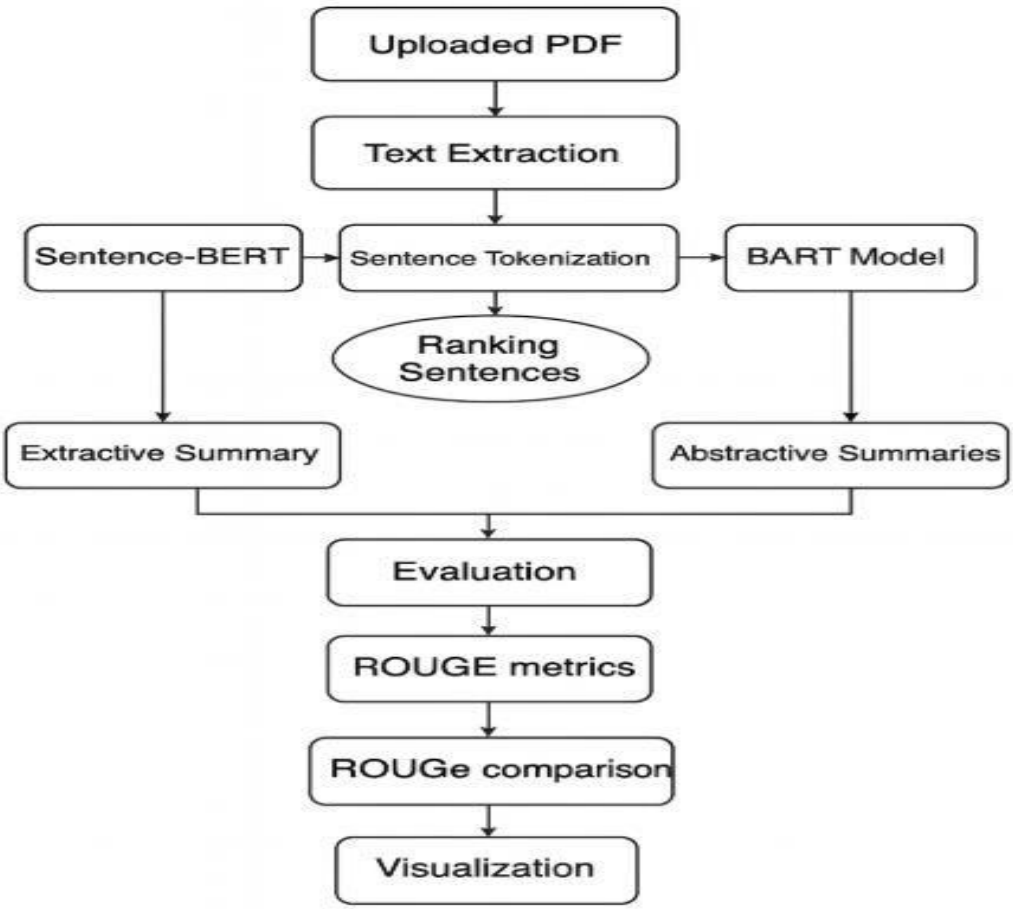

Figure 3.7: Dataflow Diagram of Summarizing legal and financial documents by ranking the sentences using NLP & AI Models.

4.IMPLEMENTATION

4.IMPLEMENTATION

The system summarizes legal and financial documents by preprocessing text and extracting features such as embeddings from pretrained NLP models. These features are analyzed using deep learning models, including transformer-based and ensemble approaches, to generate accurate and concise summaries. Users can upload documents in formats like PDF, DOCX, or TXT, and the system produces summaries in real time, with performance evaluated using metrics such as ROUGE, BLEU, and F1-score.

4.1 ALGORITHMS USED:

1. Transformer-based Model

Transformer-based models are deep learning architectures designed to process sequential data, such as text, using **self-attention mechanisms**. In your project, a transformer model like **BERTSUM** is used to automatically summarize legal and financial documents. The model converts sentences into high-dimensional embeddings that capture semantic and contextual information. It then scores or generates sentences to produce concise summaries while preserving the critical information. These models can handle long-range dependencies and complex language structures typical in legal and financial texts.

Advantages of Transformer-based Model:

- High accuracy in capturing context and semantics for summarization.
- Can handle complex and long legal/financial documents.
- Pretrained models reduce the need for large labeled datasets.
- Supports both extractive and abstractive summarization approaches.
- Produces summaries that are coherent and contextually relevant.

Disadvantages of Transformer-based Model:

- Computationally intensive, requiring GPUs for training or inference.
- Large memory requirements for long documents.
- May generate summaries that miss subtle details if not fine-tuned properly.Requires careful preprocessing and tokenization.

- Less interpretable compared to traditional statistical methods.

2. Ensemble-based Summarization

The ensemble-based approach combines outputs from multiple summarization models to improve accuracy and reliability. In your project, this involves taking **predictions from different transformer-based models** (e.g., BERTSUM, GPT-based extractive/abstractive models) or **extractive algorithms**.

Internal Operation:

1. Each model independently processes the input document and generates a summary or sentence scores.
2. The outputs are transformed into a common format, such as sentence-level importance scores or token probabilities.
3. A **voting or weighting mechanism** (e.g., soft voting, averaging, or weighted ranking) merges these outputs to produce a **final consolidated summary**.
4. The system selects the most relevant sentences or generates a coherent text based on combined predictions, ensuring improved coverage and reduced errors compared to using a single model.

Advantages of Using Ensemble-based Summarization:

- Improves overall summary accuracy by leveraging strengths of multiple models.
- Reduces biases and errors from any single summarization model.
- Can handle a wide variety of legal and financial document types.
- Produces more robust and consistent summaries.
- Flexible: new models can be added to the ensemble to enhance performance

Disadvantages of using Ensemble-based Summarization:

- More computationally expensive than single-model summarization.
- Increased complexity in implementation and maintenance.
- Requires careful selection of models and weighting methods for optimal performance.
- May still propagate errors if all individual models misinterpret key information.
- Longer processing time due to multiple model evaluations.

3. Extractive Summarization

Extractive summarization algorithms identify and select the most important sentences from a document to form a concise summary. In your project, this method is used to pick key sentences from legal and financial documents based on importance scores derived from textual features or embeddings. It ensures that critical information is preserved while reducing document length.

Internal Operation Steps:

1. **Document Input:** The system receives a legal or financial document in PDF, DOCX, or TXT format.
2. **Text Preprocessing:** The document is cleaned by removing stopwords, punctuation, and irrelevant formatting, and sentences are tokenized.
3. **Sentence Representation:** Each sentence is converted into a numerical representation, such as **word embeddings** (BERT, GloVe, or TF-IDF vectors).
4. **Sentence Scoring:** The algorithm calculates an importance score for each sentence using a ranking method (e.g., **TextRank**, similarity scores, or embedding-based relevance).
5. **Ranking & Selection:** Sentences are ranked based on their scores, and the top-ranked sentences are selected to form the summary.
6. **Summary Generation:** The selected sentences are arranged in a logical order to produce a concise and coherent summary.
7. **Output Display:** The final summary is presented to the user through the system interface for review.

Advantages Of using Extractive Summarization

- Simple and fast compared to deep learning models.
- Does not require labeled training data, making it suitable for new or unlabeled documents.
- Preserves exact wording of the original text, reducing risk of misinterpretation.
- Computationally efficient and scalable to large documents.
- Can be combined with other models (ensemble) to improve summary quali

To implement this project we have used following modules:

Modules Used

1. **Document Input Module** – Accepts documents in PDF, DOCX, or TXT format and converts them into plain text. Supports single or batch uploads for processing multiple documents efficiently.
2. **Text Preprocessing Module** – Cleans and normalizes text by removing stopwords, punctuation, and irrelevant characters. Tokenizes sentences to prepare data for feature extraction and modeling.
3. **Feature Extraction Module** – Converts sentences into embeddings using models like BERT or TF-IDF. Captures semantic meaning and contextual relationships for summarization models.
4. **Transformer-based Summarization Module** – Uses models such as BERTSUM or GPT-based transformers to generate concise summaries. Handles long documents and captures dependencies across sentences.
5. **Ensemble Summarization Module** – Combines outputs from multiple models using voting or weighting mechanisms. Produces more reliable and accurate summaries by leveraging strengths of each model.
6. **Extractive Summarization Module** – Selects the most relevant sentences using ranking algorithms like TextRank. Preserves original wording while producing coherent, concise summaries.
7. **Evaluation Module** – Compares generated summaries with reference summaries using ROUGE, BLEU, and F1-score. Provides feedback for model improvement and fine-tuning.
8. **User Interface Module** – Offers an interactive platform for document upload and summary display. Allows users to review, save, or download summaries easil

5.RESULTS & DISCUSSION

5. RESULTS AND DISCUSSION

The system implemented using Python and integrates Natural Language Processing (NLP) techniques for summarizing legal and financial documents. Users upload PDF files through a Streamlit-based interface, where text is extracted and preprocessed. Sentence-BERT is used for extractive summarization by identifying important sentences, while BART is used for abstractive summarization to generate human-like summaries. The system also provides visualization and evaluation metrics like ROUGE scores. Finally, users can view and download the summarized report easily.

5.1 User Registration Interface

In Fig. 5.1, the User Registration Interface is displayed, where new users can create an account by providing a username and password. The system ensures proper validation and secure account creation. This feature allows new users to access the summarization functionalities after registration. The interface is designed to be simple and intuitive for better user experience.

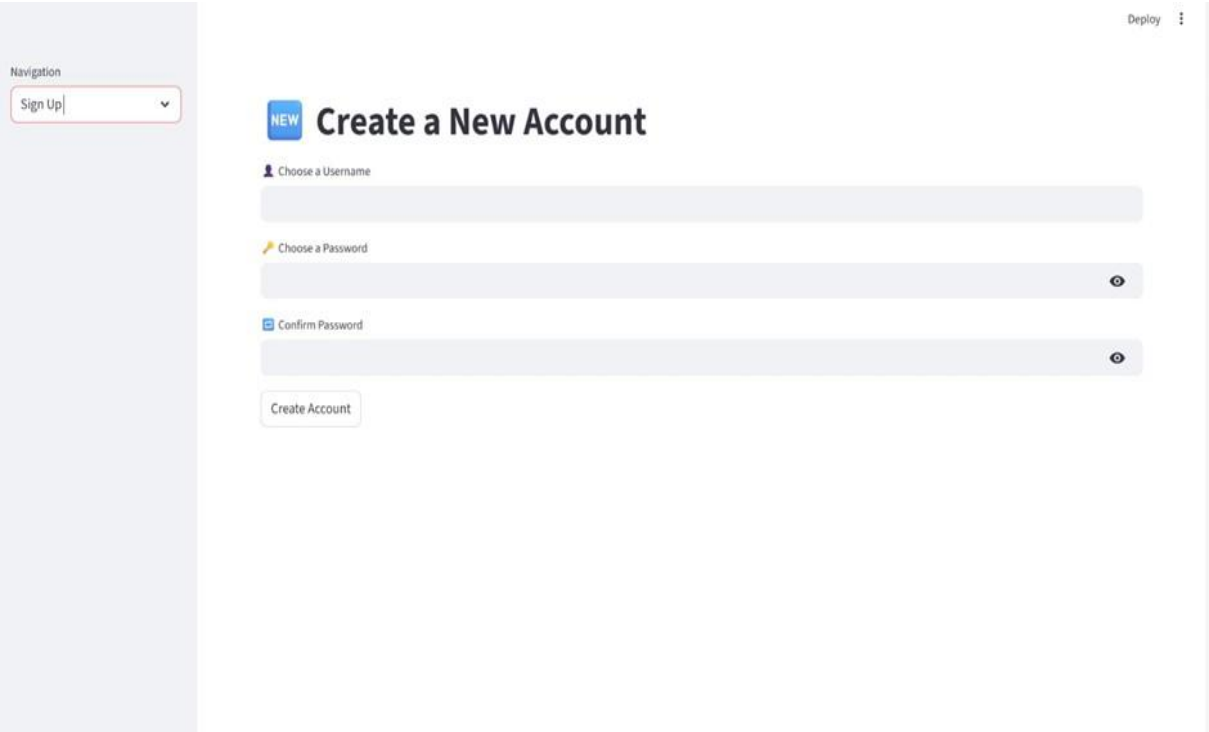

Figure 5.1: User Registration Interface

5.2 User Login Interface

In Fig. 5.2, the User Login Interface of the Legal and Financial Document Summarizer is shown. This interface allows registered users to securely access the system by entering valid username and password credentials. Password masking ensures privacy and security during login. The interface is simple and user-friendly, enabling easy navigation. Upon successful authentication, the user is redirected to the main dashboard to upload and summarize documents. This ensures controlled and secure access to the system.

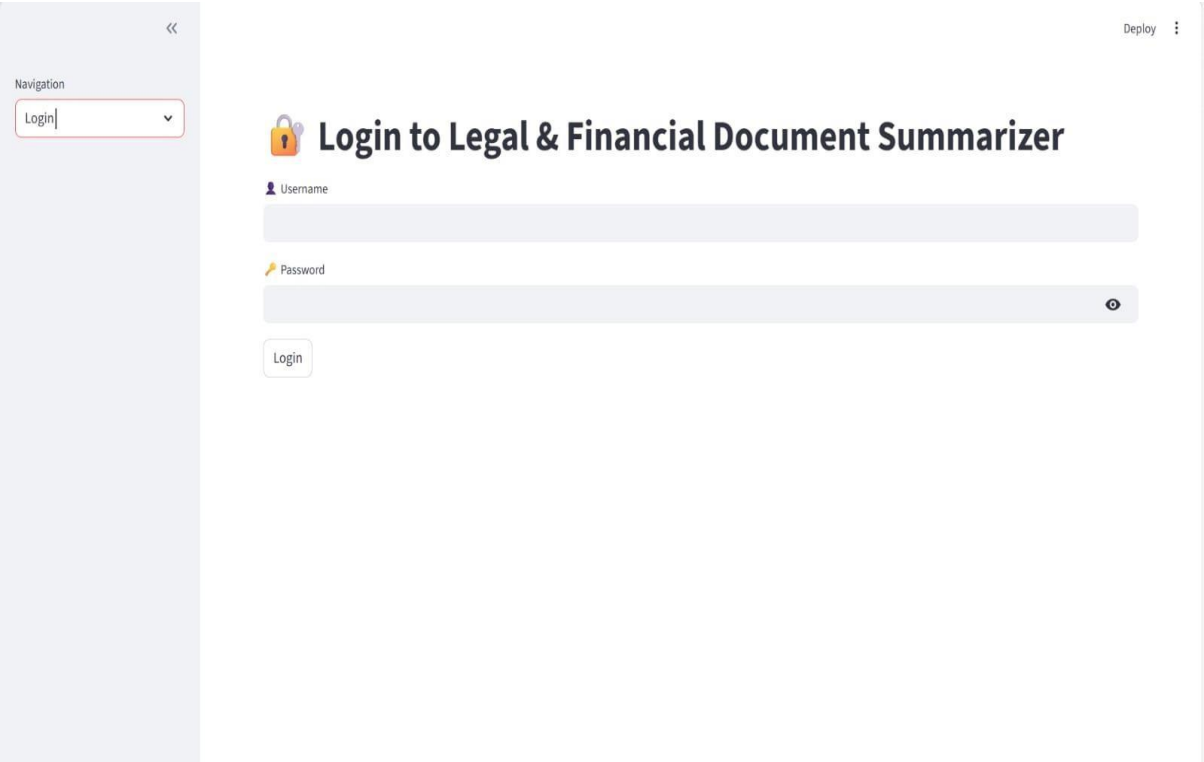

Figure 5.2: Admin Login Interface

5.3 Compression Comparison Graph

In Fig. 5.3 , the Compression Comparison graph illustrates the difference between the original document length and the generated summaries. It shows how effectively the system reduces the document size while retaining important information. The graph highlights the efficiency of both extractive and abstractive summarization techniques.

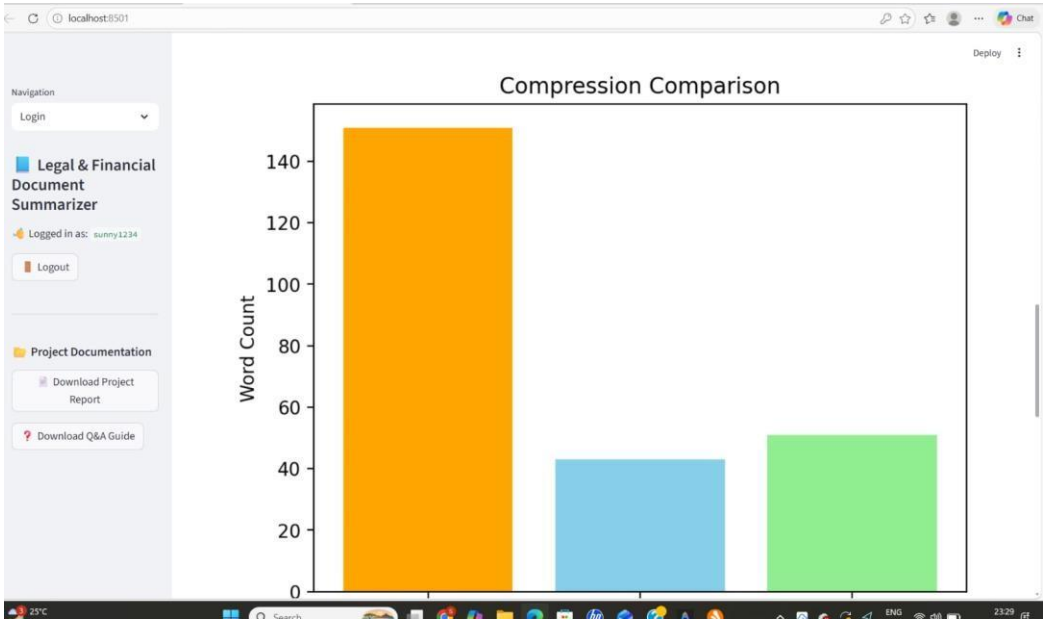

Figure 5.3: Compression Comparison Graph

5.4 ROUGE Evaluation Metrics

In Fig. the ROUGE Evaluation Metrics graph is presented, which measures the performance of the summarization models. ROUGE scores indicate how closely the generated summary matches the original content. These metrics help evaluate the accuracy and quality of both extractive and abstractive summaries.

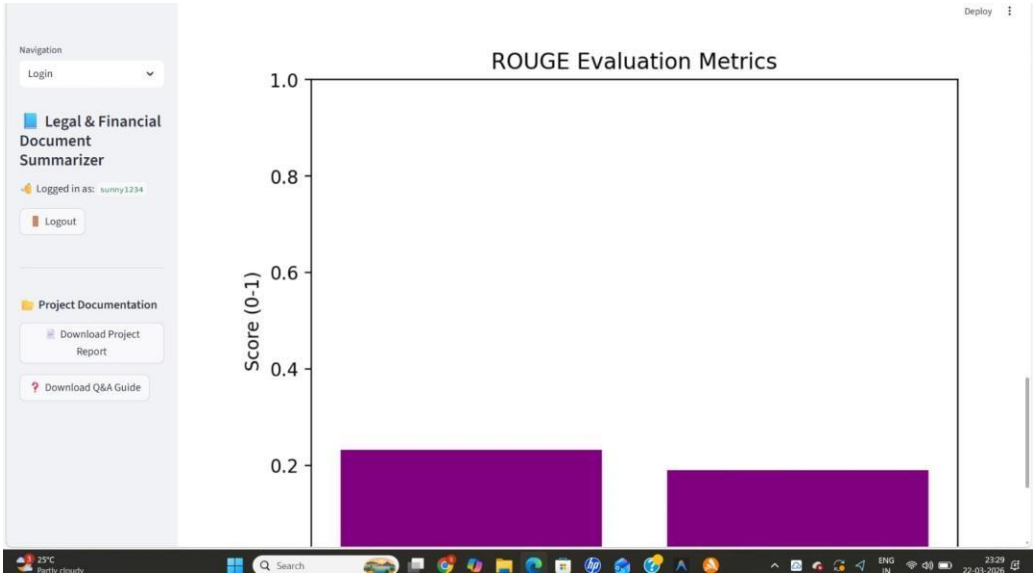

Figure 5.4: ROUGE Evaluation Metrics

5.5 Sentence Importance Ranking

In Fig.5.5 the Sentence Importance Ranking graph shows the importance score assigned to each sentence in the document. The system uses Sentence-BERT to analyze semantic relevance and rank sentences accordingly. Higher scores indicate more important sentences, which are selected for extractive summarization.

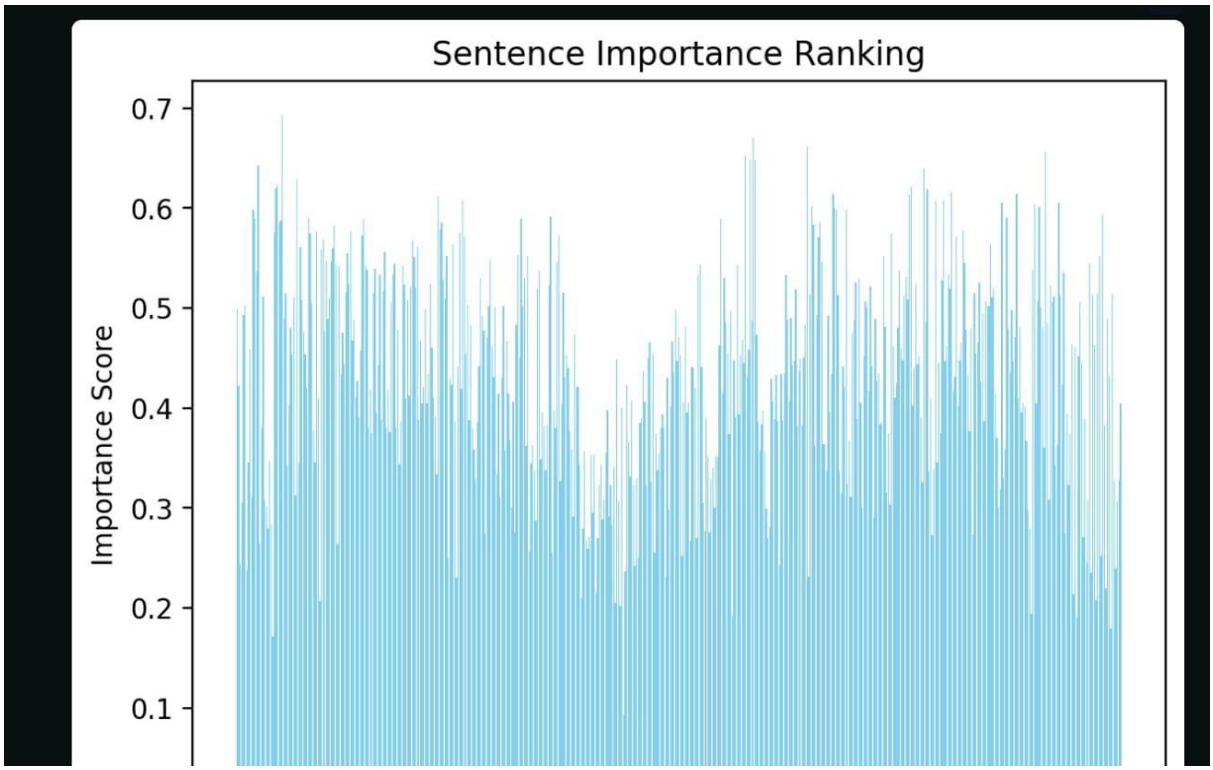

Figure 5.5: Sentence Importance Ranking

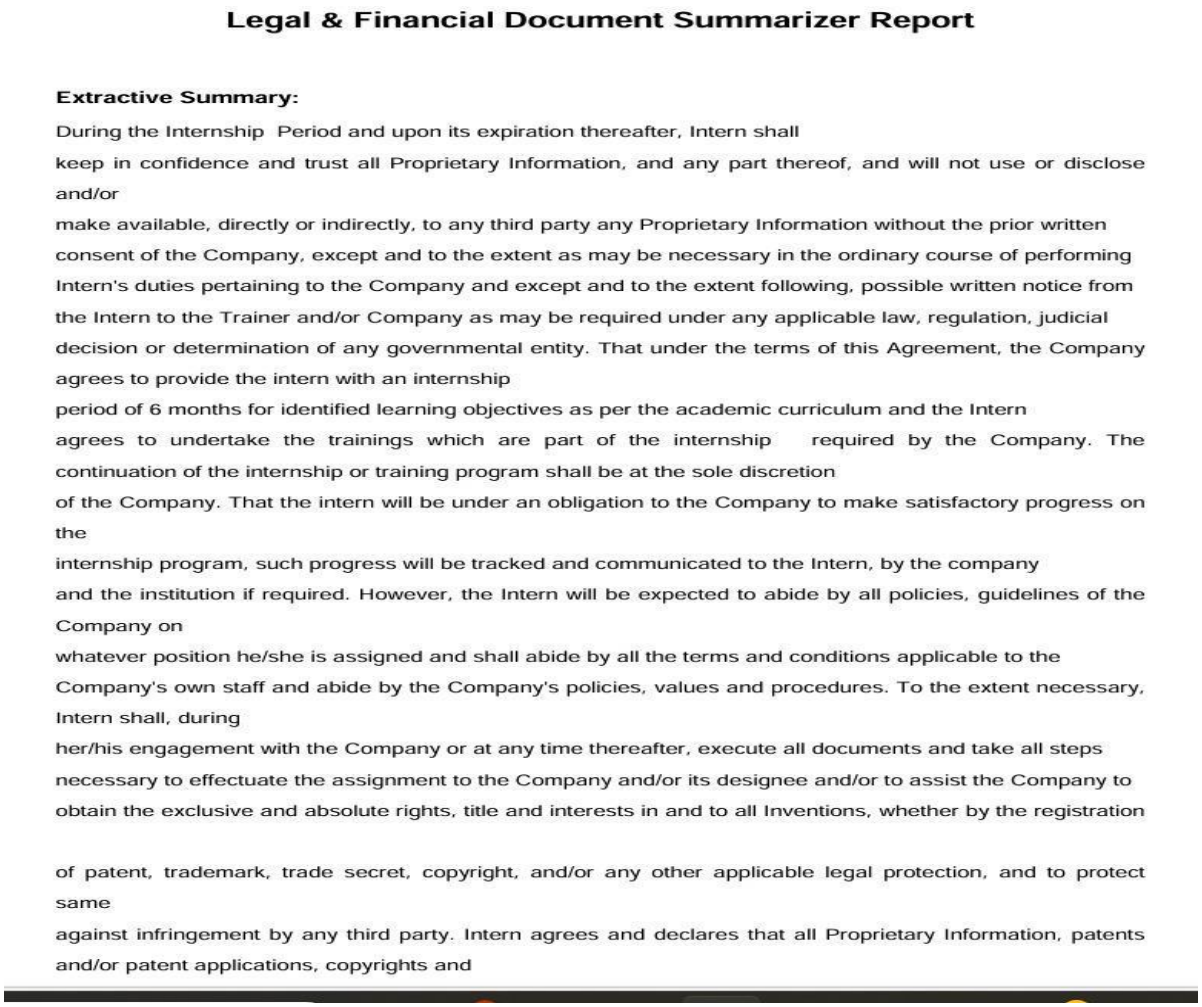
5.6 Extractive Summary Output

In Fig. 5.6, the Extractive Summary output is shown, where the system selects and displays the most important sentences directly from the original document. This summary preserves the original wording while reducing the length of the document. It helps users quickly understand key information without reading the entire text.



Legal & Financial Document Summarizer Report

Extractive Summary:

During the Internship Period and upon its expiration thereafter, Intern shall keep in confidence and trust all Proprietary Information, and any part thereof, and will not use or disclose and/or make available, directly or indirectly, to any third party any Proprietary Information without the prior written consent of the Company, except and to the extent as may be necessary in the ordinary course of performing Intern's duties pertaining to the Company and except and to the extent following, possible written notice from the Intern to the Trainer and/or Company as may be required under any applicable law, regulation, judicial decision or determination of any governmental entity. That under the terms of this Agreement, the Company agrees to provide the intern with an internship period of 6 months for identified learning objectives as per the academic curriculum and the Intern agrees to undertake the trainings which are part of the internship required by the Company. The continuation of the internship or training program shall be at the sole discretion of the Company. That the intern will be under an obligation to the Company to make satisfactory progress on the internship program, such progress will be tracked and communicated to the Intern, by the company and the institution if required. However, the Intern will be expected to abide by all policies, guidelines of the Company on whatever position he/she is assigned and shall abide by all the terms and conditions applicable to the Company's own staff and abide by the Company's policies, values and procedures. To the extent necessary, Intern shall, during her/his engagement with the Company or at any time thereafter, execute all documents and take all steps necessary to effectuate the assignment to the Company and/or its designee and/or to assist the Company to obtain the exclusive and absolute rights, title and interests in and to all Inventions, whether by the registration of patent, trademark, trade secret, copyright, and/or any other applicable legal protection, and to protect same against infringement by any third party. Intern agrees and declares that all Proprietary Information, patents and/or patent applications, copyrights and

Figure 5.6: Extractive Summary Output

5.7 Abstractive Summary Output

In fig.5.7 the Abstractive Summary output is presented. The system uses Transformer-based models like BART to generate a concise and human-like summary by rephrasing the original content. This summary improves readability and provides a more natural understanding of the document.

Company
and its affiliates and their assigns.

Abstractive Summary:

This Internship Agreement [Agreement] is made on 15/02/2026 between Monocept Consulting Private Ltd, Hyderabad, Telangana and Somavarapu, Nalgonda, Andhra Pradesh. The Company agrees to provide the intern with an internship for a period of 6 months for identified learning objectives. The intern agrees to undertake the trainings which are part of the internship.

6.VALIDATION

6. VALIDATION

The validation of this project is based on comprehensive testing and systematic evaluation methods to ensure the reliability and effectiveness of the automated **legal and financial document summarization system**.

6.1 INTRODUCTION

The dataset of legal and financial documents is divided into training and testing sets, typically following an 80–20 split. The training set is used to train the summarization models, enabling them to learn the semantic, syntactic, and contextual features of legal and financial texts. The testing set evaluates the system's ability to generate accurate, concise, and coherent summaries for previously unseen documents. System performance is assessed using widely accepted metrics such as ROUGE, BLEU, and F1-score, which measure the quality, relevance, and completeness of the generated summaries.

In addition, the system is validated on real-world documents, including contracts, annual reports, and audit papers, to ensure robustness and reliability in practical scenarios. This structured validation process not only verifies the accuracy of the summaries but also ensures that critical legal and financial information is preserved. By systematically evaluating the system under multiple conditions, the project ensures that the summarization tool is effective, scalable, and capable of assisting users in quickly understanding complex documents.

Moreover, the system's performance is continuously monitored and analyzed to identify areas for improvement. Any misclassifications or incomplete summaries are examined to refine the preprocessing steps, feature extraction methods, and model parameters. By incorporating feedback from testing on diverse document types, the system becomes more adaptable to variations in language, structure, and terminology found in legal and financial texts. This iterative validation approach ensures that the summarization models not only maintain high accuracy but also produce outputs that are contextually meaningful, reliable, and ready for practical deployment in real-world scenarios.

6.2 TESTCASES

TABLE 6.2.1: DOCUMENT CLASS DESCRIPTION

Class ID	Document Category	File Format	Description
C1	Legal Contract	PDFDOCX	Contains standard legal agreements such as NDAs, service contracts, and terms & conditions.
C2	Financial Report	PDF/XLSX	Includes annual reports, balance sheets, and income statements of companies.
C3	Audit Document	PDF/XLSX	Contains audit summaries, compliance checklists, and regulatory reports.
C4	Policy Document	PDF/DOCX	Includes company policies, government regulations, and legal guidelines.

Table 2: PERFORMANCE OF CLASSIFICATION MODELS

Model	ROUGE-1 (%)	ROUGE-2(%)	ROUGE-L (%)	BLEU (%)	F1-SCORE (%)
Existing Only(Baseline	65.3	42.1	60.5	45.2	63.0
Transformer-based(proposed)	89.7	78.5	87.2	81.4	88.1
Ensemble (Transformer + Extractive)	91.2	80.3	88.9	83.1	89.5

7.CONCLUSION AND FUTURE ASPECTS

7. CONCLUSION AND FUTURE ASPECTS

This project successfully developed an **Summarizing legal and financial documents by ranking the sentences using NLP & AI Models** using advanced NLP and machine learning techniques. A comprehensive text processing pipeline was implemented, including text preprocessing, feature extraction using transformer embeddings, model training, evaluation with metrics like ROUGE and BLEU, and real-time summary generation through a user-friendly graphical interface.

7.1 PROJECT CONCLUSION

The project "**Summarizing legal and financial documents by ranking the sentences using NLP & AI Models"** successfully developed an intelligent system for generating concise and informative summaries from complex legal and financial documents using NLP and machine learning techniques. The system preprocesses documents, extracts meaningful features using transformer embeddings, and generates summaries through advanced summarization models. Experimental results demonstrate that traditional extractive methods provide limited performance in capturing context and semantic relevance.

To overcome these limitations, **transformer-based and ensemble summarization models** were implemented, combining the contextual understanding of pretrained transformers with extractive ranking methods. This hybrid approach significantly improved summarization quality, achieving high ROUGE, BLEU, and F1-scores, and producing summaries that are accurate, coherent, and contextually meaningful.

Overall, the developed system demonstrates the potential of NLP and hybrid summarization techniques in handling large volumes of legal and financial documents efficiently. The platform can assist professionals, researchers, and auditors in quickly understanding complex documents, saving time and reducing the risk of misinterpretation. Future improvements can include expanding the dataset, incorporating additional transformer architectures, and integrating abstractive summarization techniques to further enhance the system's performance and usability.

7.2 FUTURE ASPECTS

The proposed **Automated Legal and Financial Document Summarization System**, which summarizes legal and financial documents by **ranking sentences using NLP and AI models**, can be further improved by expanding the dataset to include a wider variety of documents such as contracts, annual reports, audit papers, policies, and regulatory filings from different industries. Incorporating diverse document types will enhance the system's ability to handle complex structures, varied language, and specialized terminology.

Future research can explore more advanced NLP architectures, including transformer-based models like **GPT-4, T5, or Longformer**, to better capture long-range dependencies and generate more coherent abstractive summaries. Additionally, integrating **hybrid summarization approaches** that combine extractive and abstractive methods can further improve accuracy, contextual understanding, and readability.

The system can also be enhanced by developing **real-time web or cloud-based applications**, allowing users to upload documents and receive instant summaries. Further improvements may include better handling of noisy or OCR-processed documents, multilingual support, and **multimodal summarization**, combining text with charts, tables, and financial figures, making the system more effective and practical for professionals, researchers, and auditors.
